Contex-aware

*Scalable

2* ~ TelosB sensors to monitor temperature, humidity and luminosity

1* ~ TelosB base station

1* ~ PC that act EdgeDevice

1* ~ Android mobile Device

Challenges

- Measurement Frequency
- Radio communication fails between TelosB
- Sensors Placement
- Uncertainty

Challenges

- **MQTT implementation with QoS=1 to balance RealTime constraints & Reliability**
- **Flow management**

Challenges

- Integration of Node-red and InfluxDB
- Integration of InfluxDB and Grafana

Challenges

- Design following the JetPackCompose Paradigm
- Real time syncronization with the sensors datas on Firebase

Features

Dashboard that provides real-time visualization of the sensors datas	Real time synchronization with Android mobile devices
Cloud integration to store and share data	Easy scalable system

What did we use?

TinyOS (.nc)	Python
Firebase	MQTT (Nodered+ Mosqitto)
Grafana	Android

Future development

Implementation of actuation to change temp, hum, lum	Reinforced learning model for auto-regulation of the actuators
Implementation of area data inference model	Advise deployment AI System for better positioning of the sensors
