- **Used technologies**
- **Future development**

# Goals

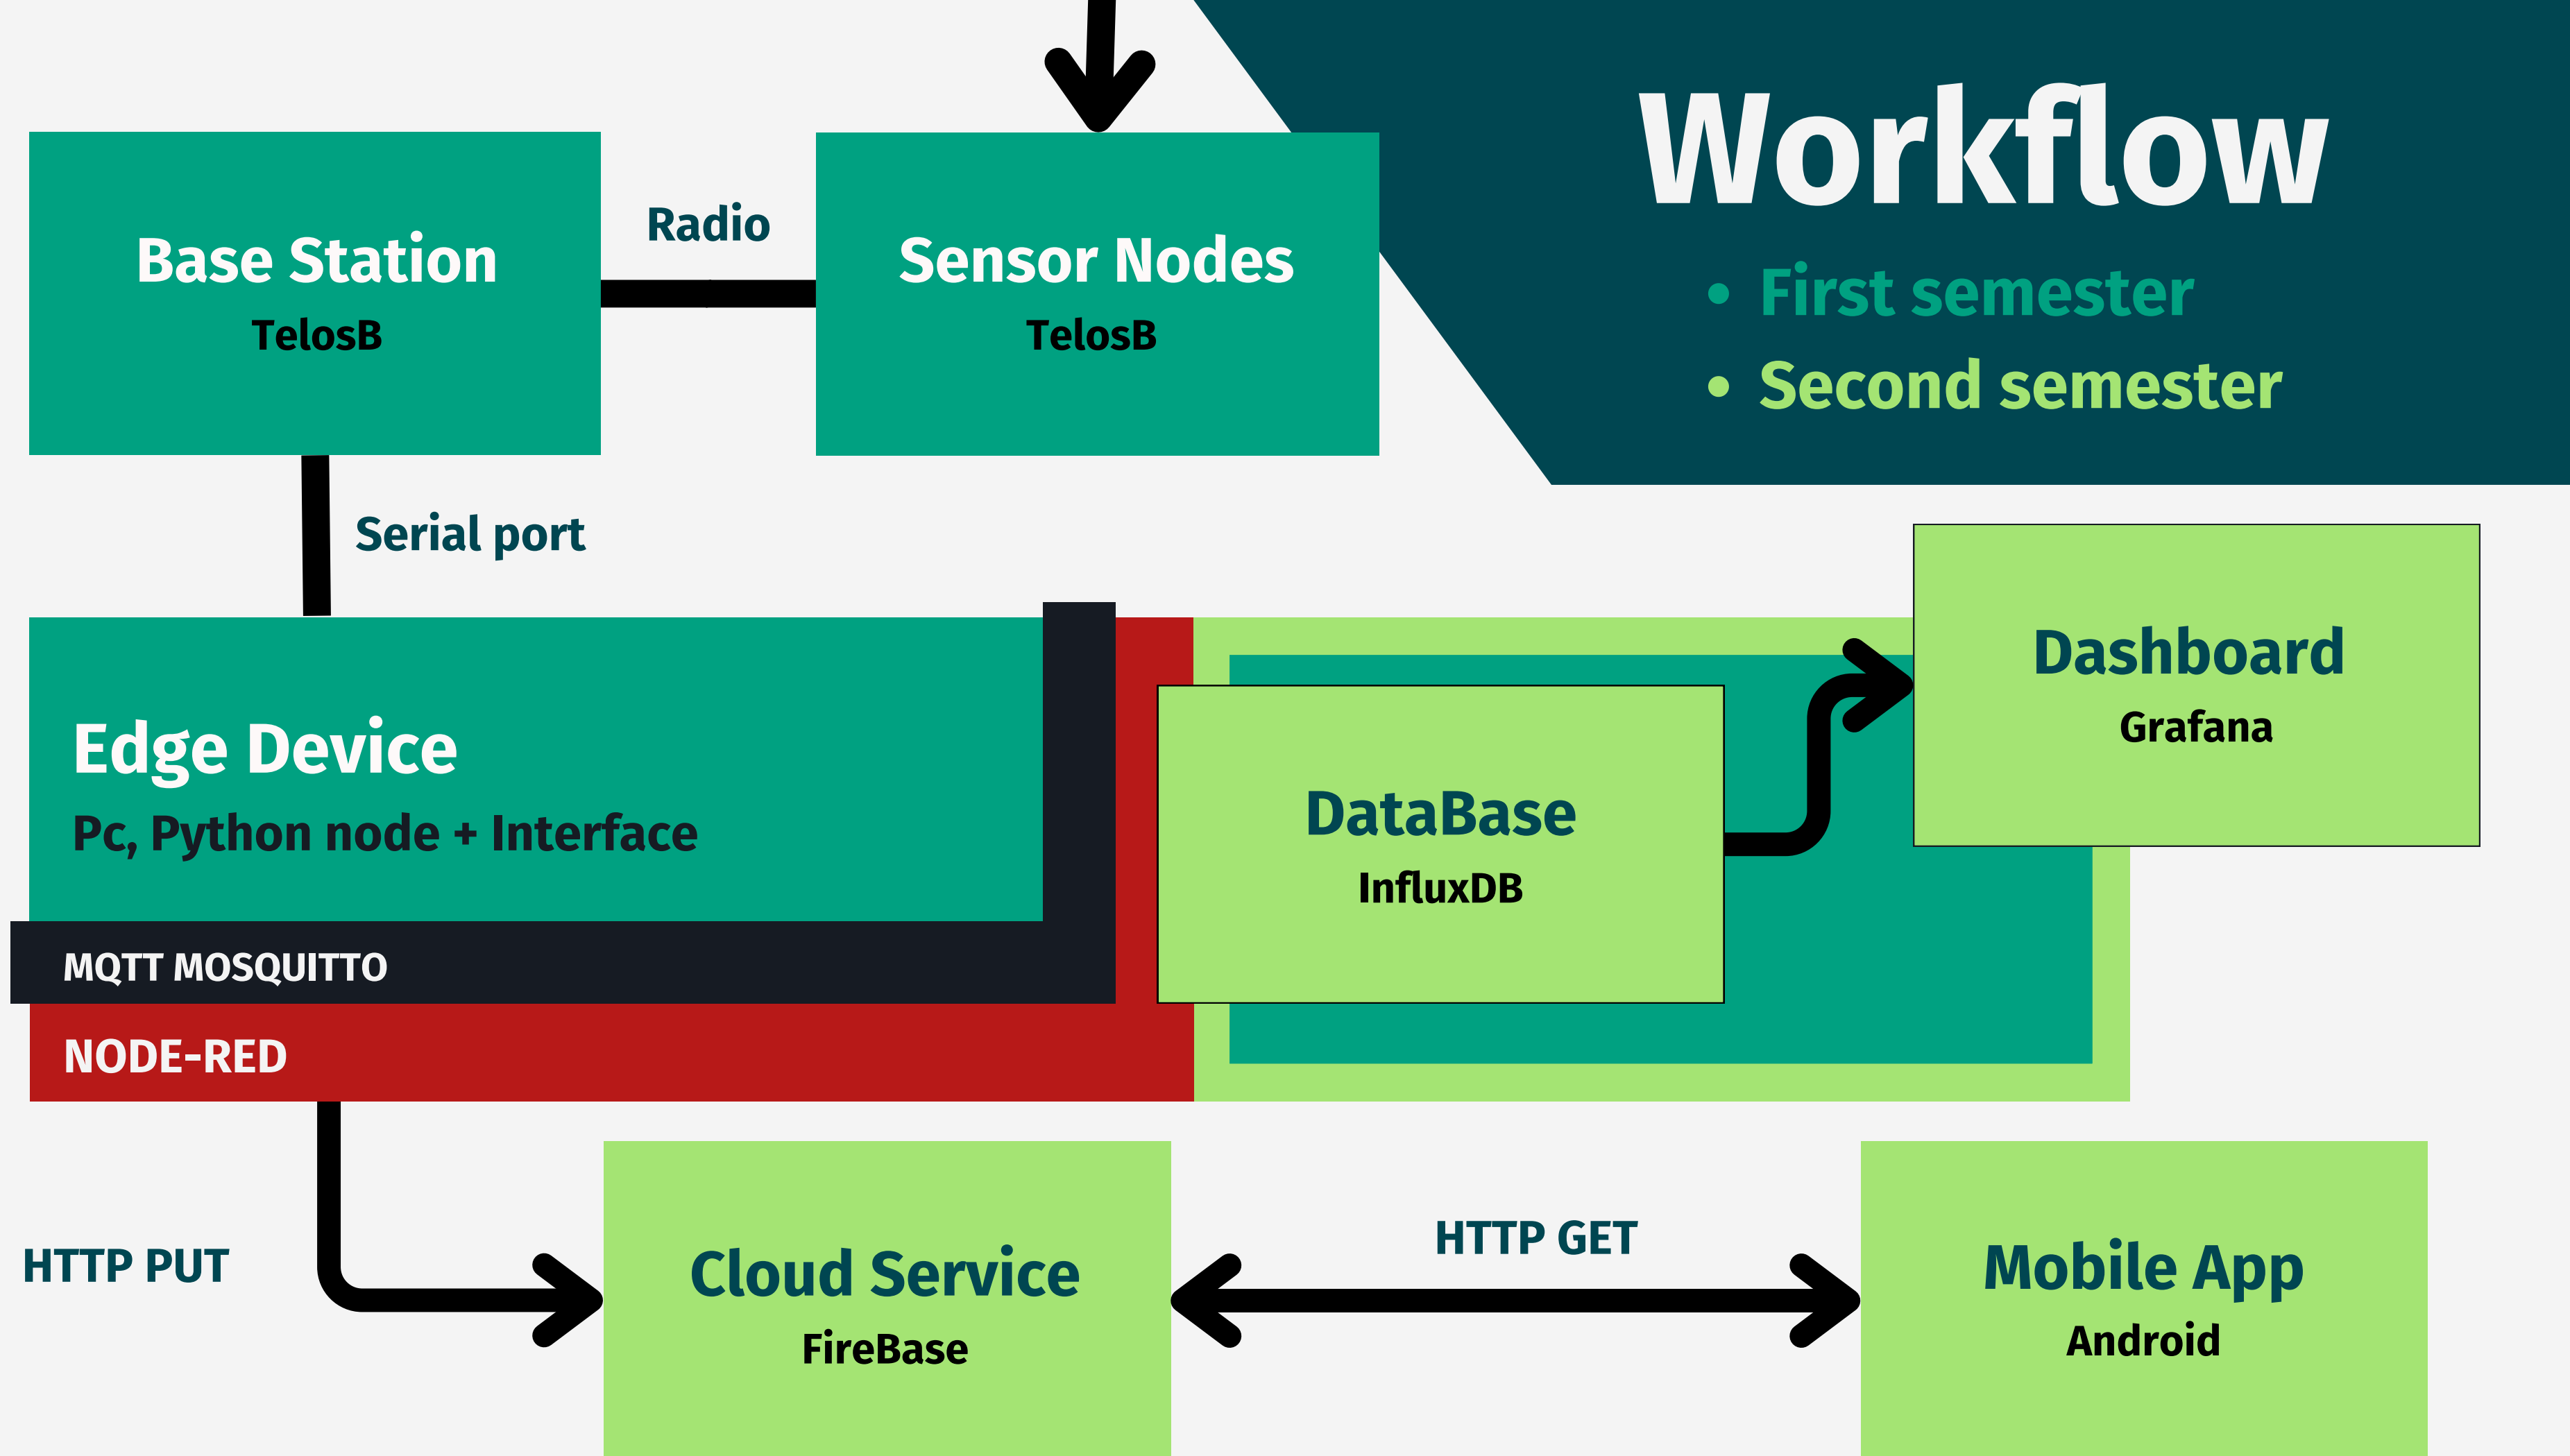

**Main Goal:**

**Museum's environment  
Monitoring Dashboard**

**Side Goal:**

**Museum's environment  
Realtime updating**

**Sensor Nodes**

**TelosB**

**radio**

**Base Station**

**TelosB**

**Serial Port**

**Edge Device**

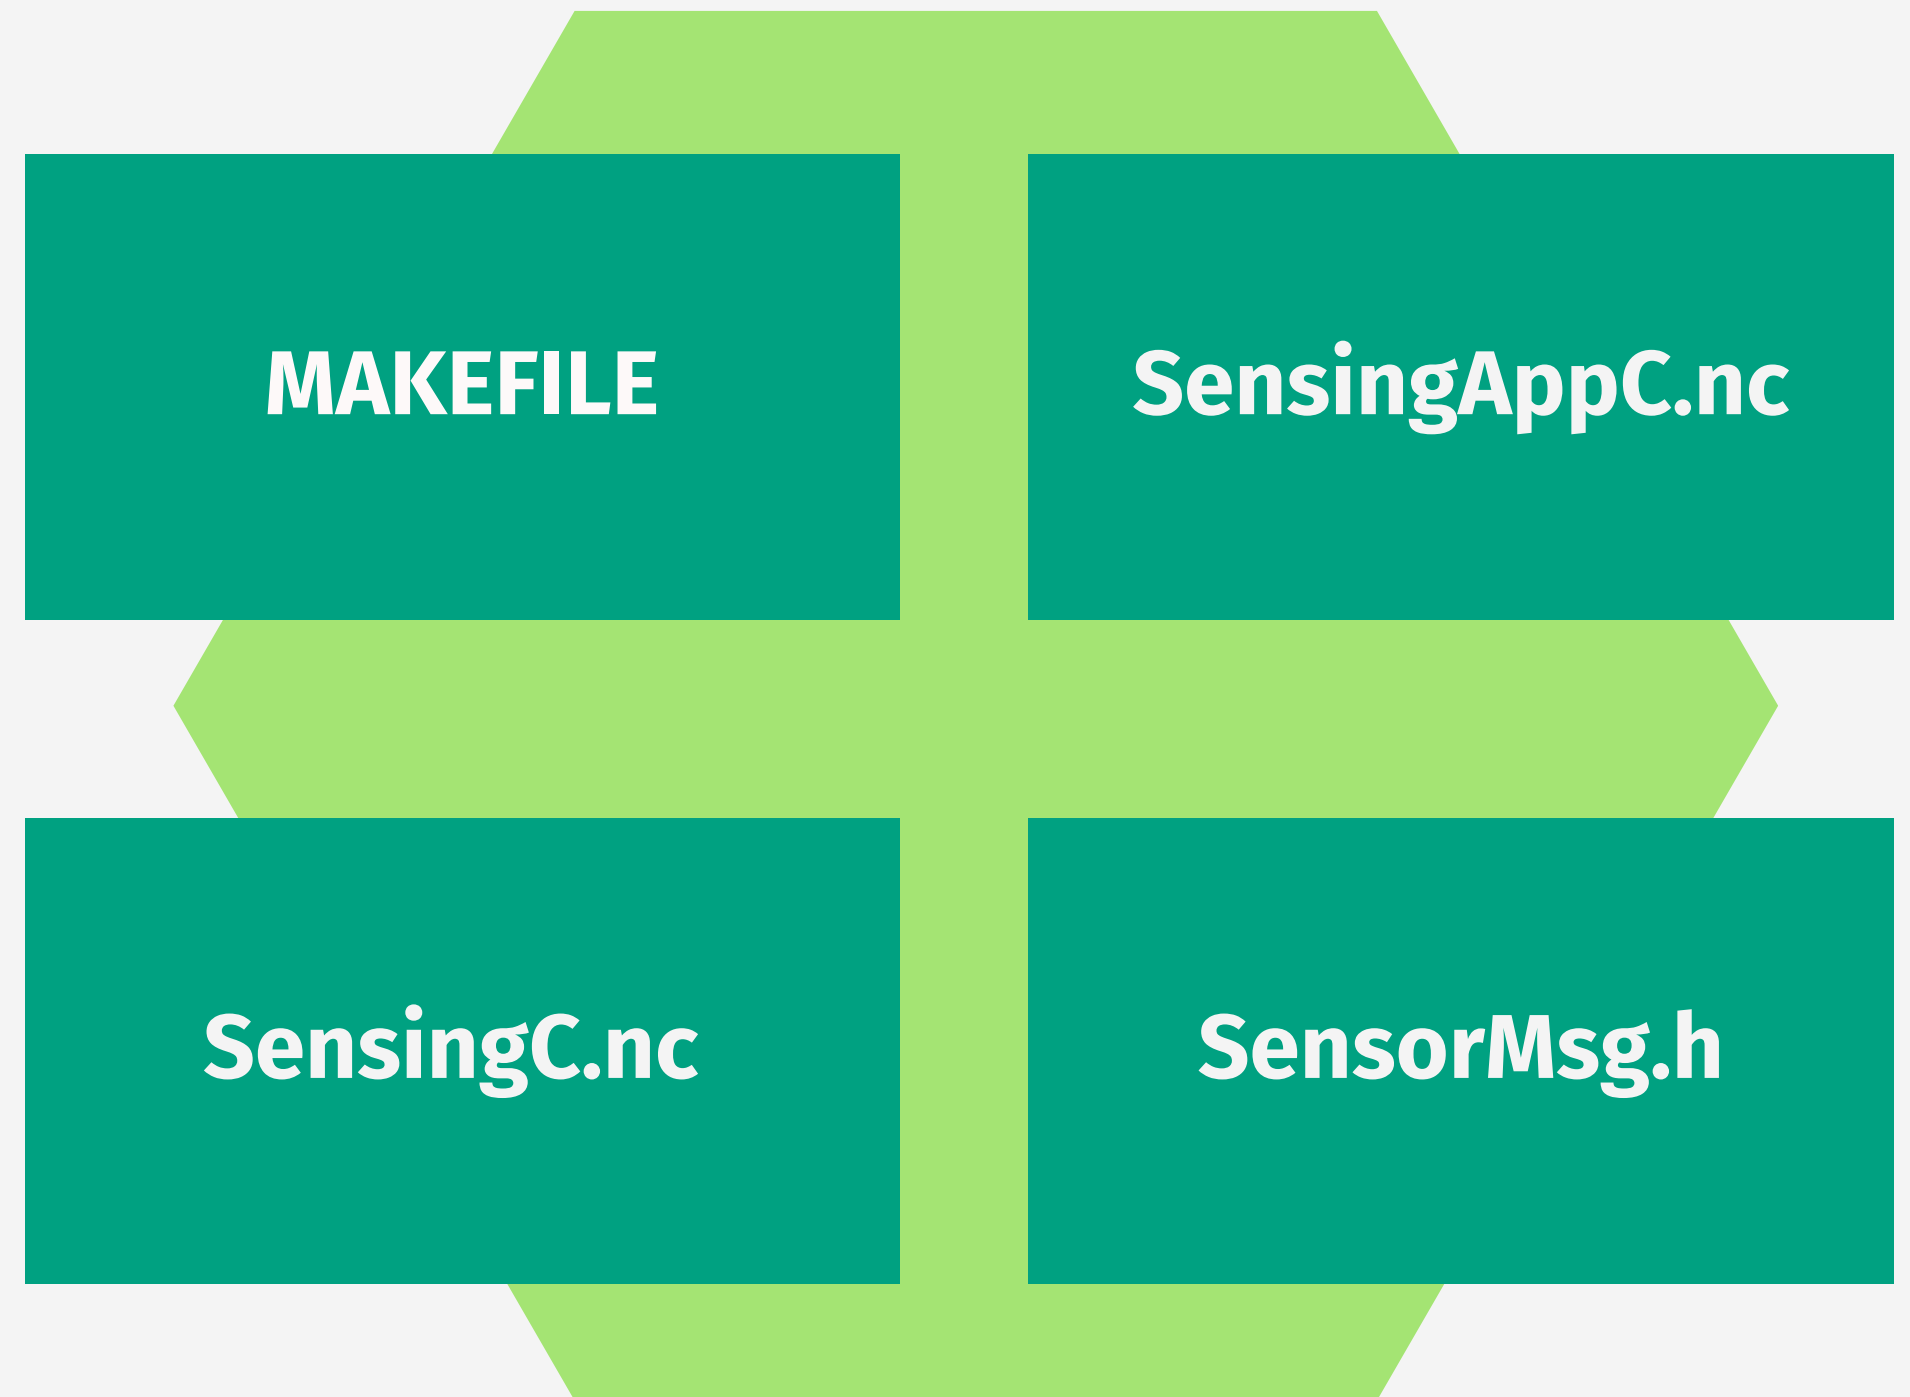

**PC, Python Interface**

# Sensor Nodes

**2 TelosB**

# Base Station

**1 TelosB**

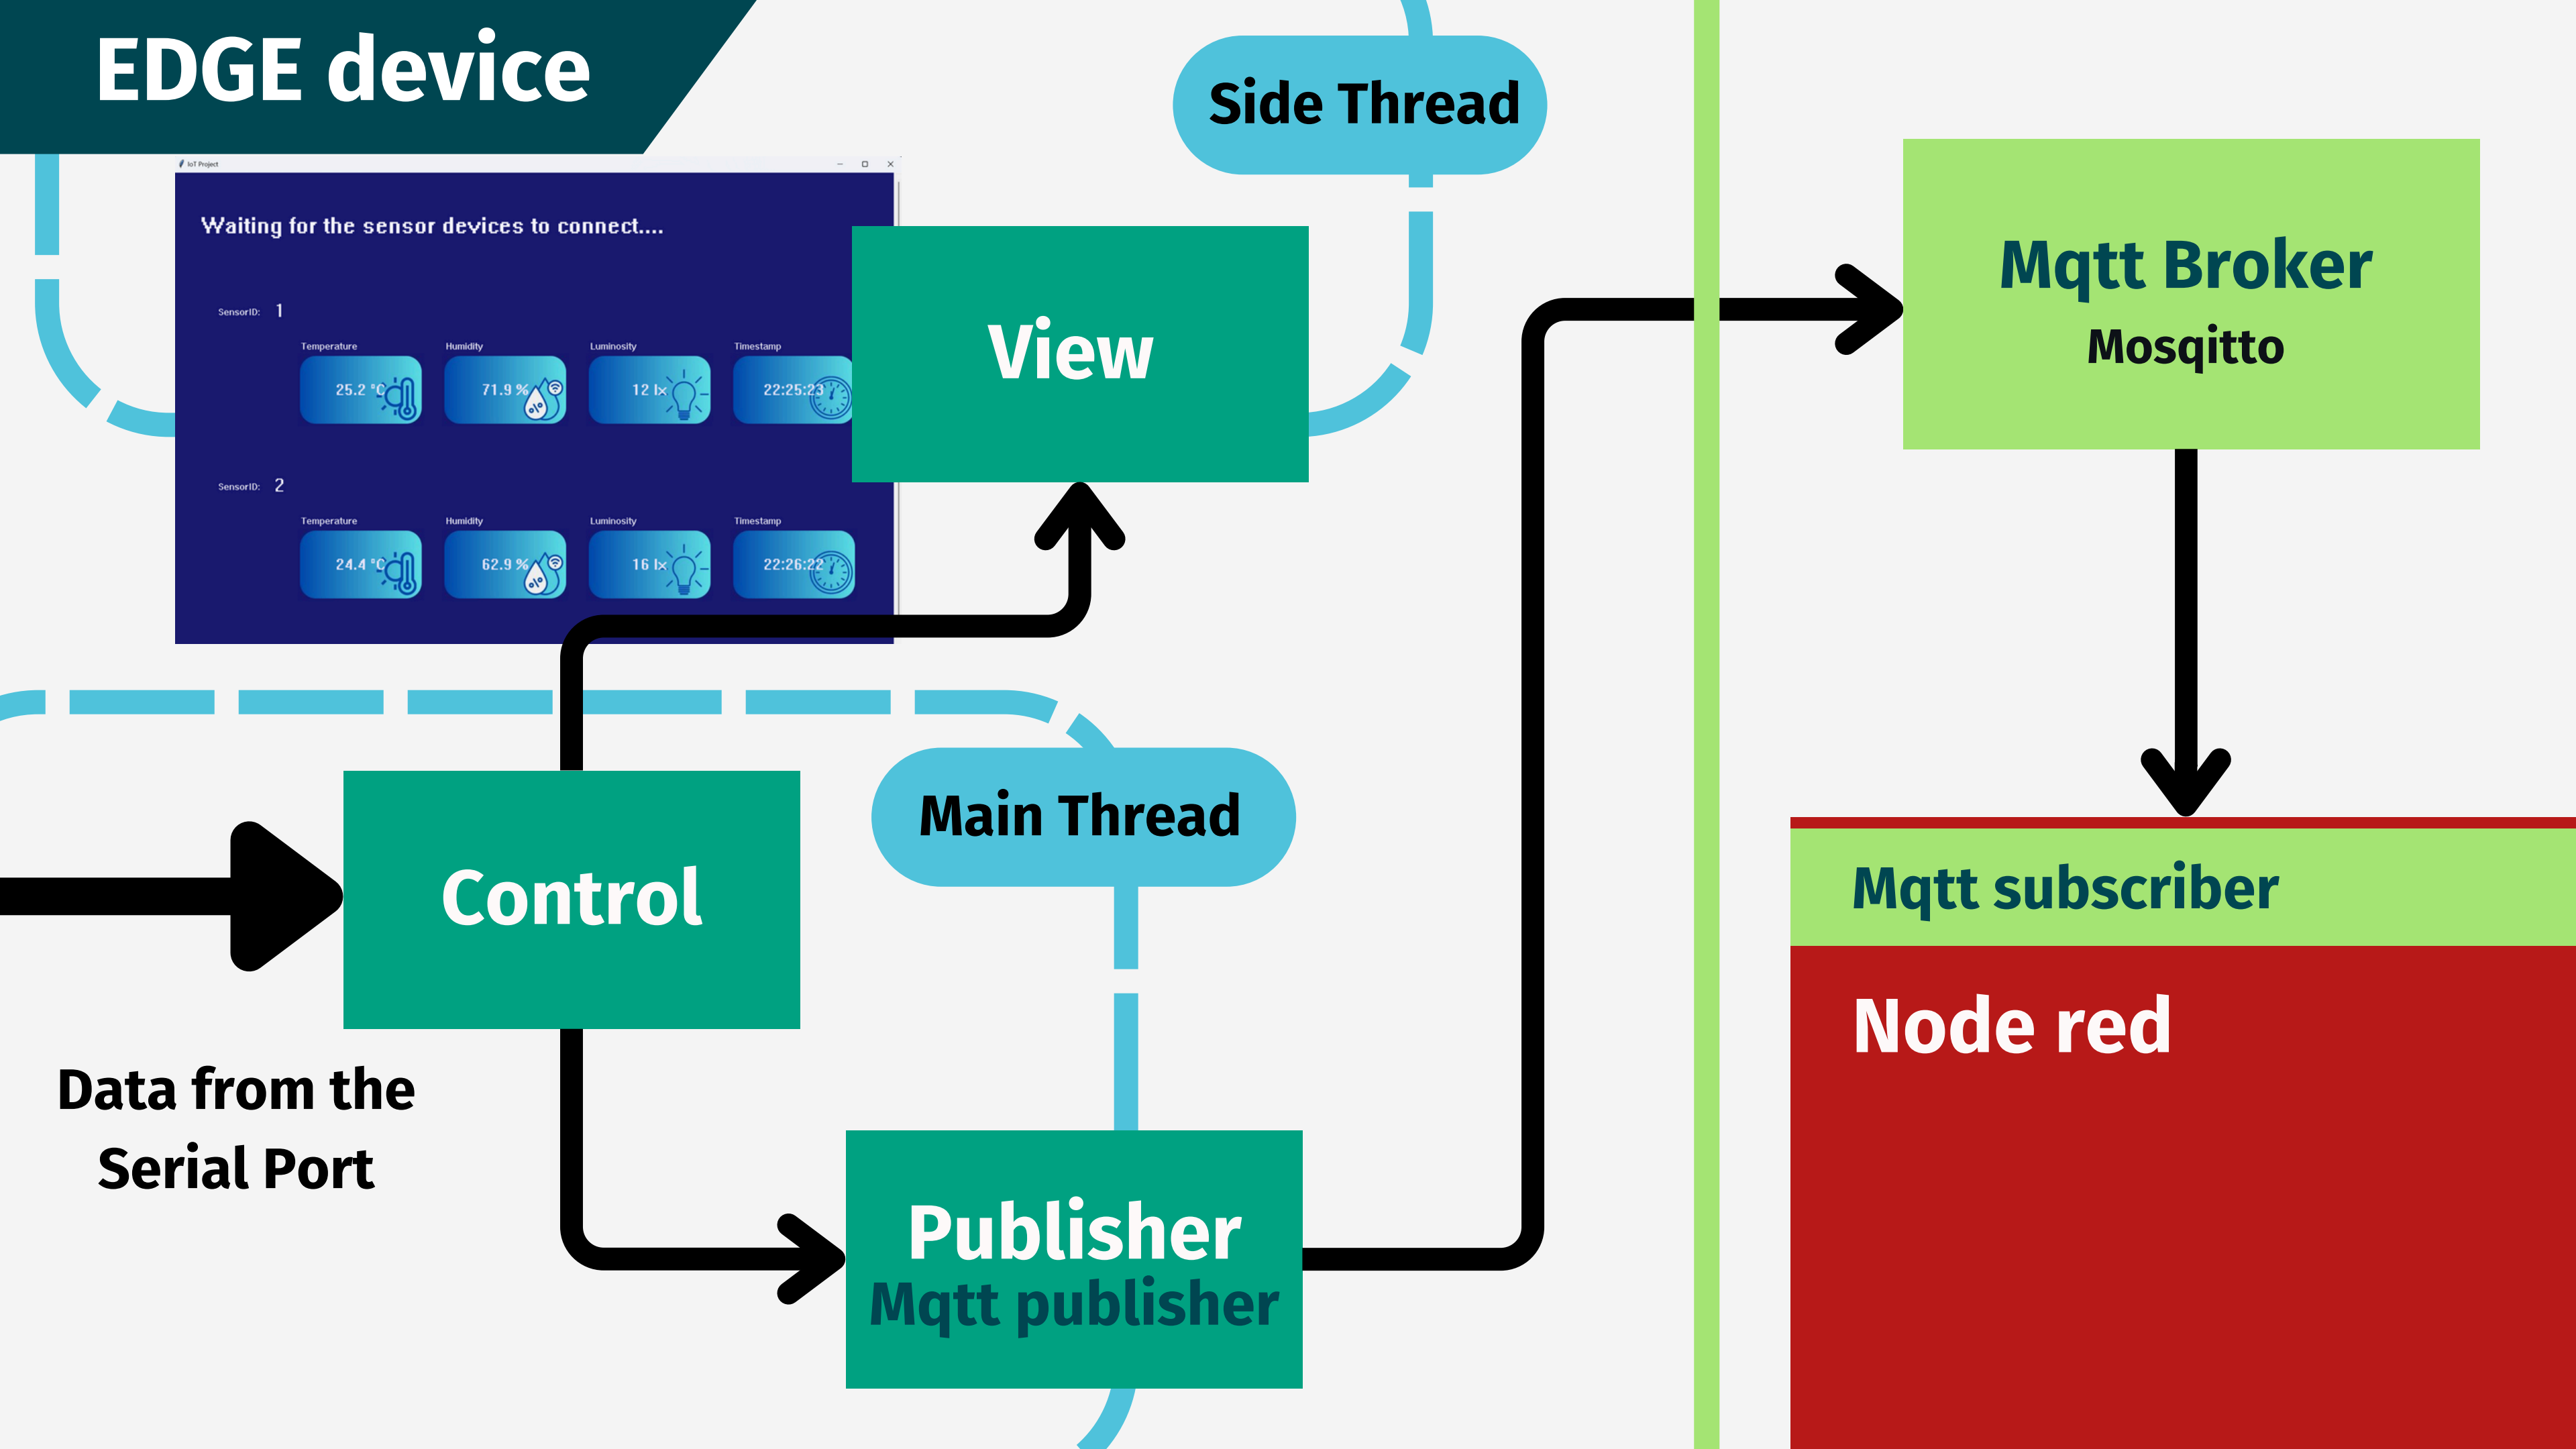

**MAKEFILE**

**SimpleReceiver  
AppC.nc**

**SimpleReceiverC.nc**

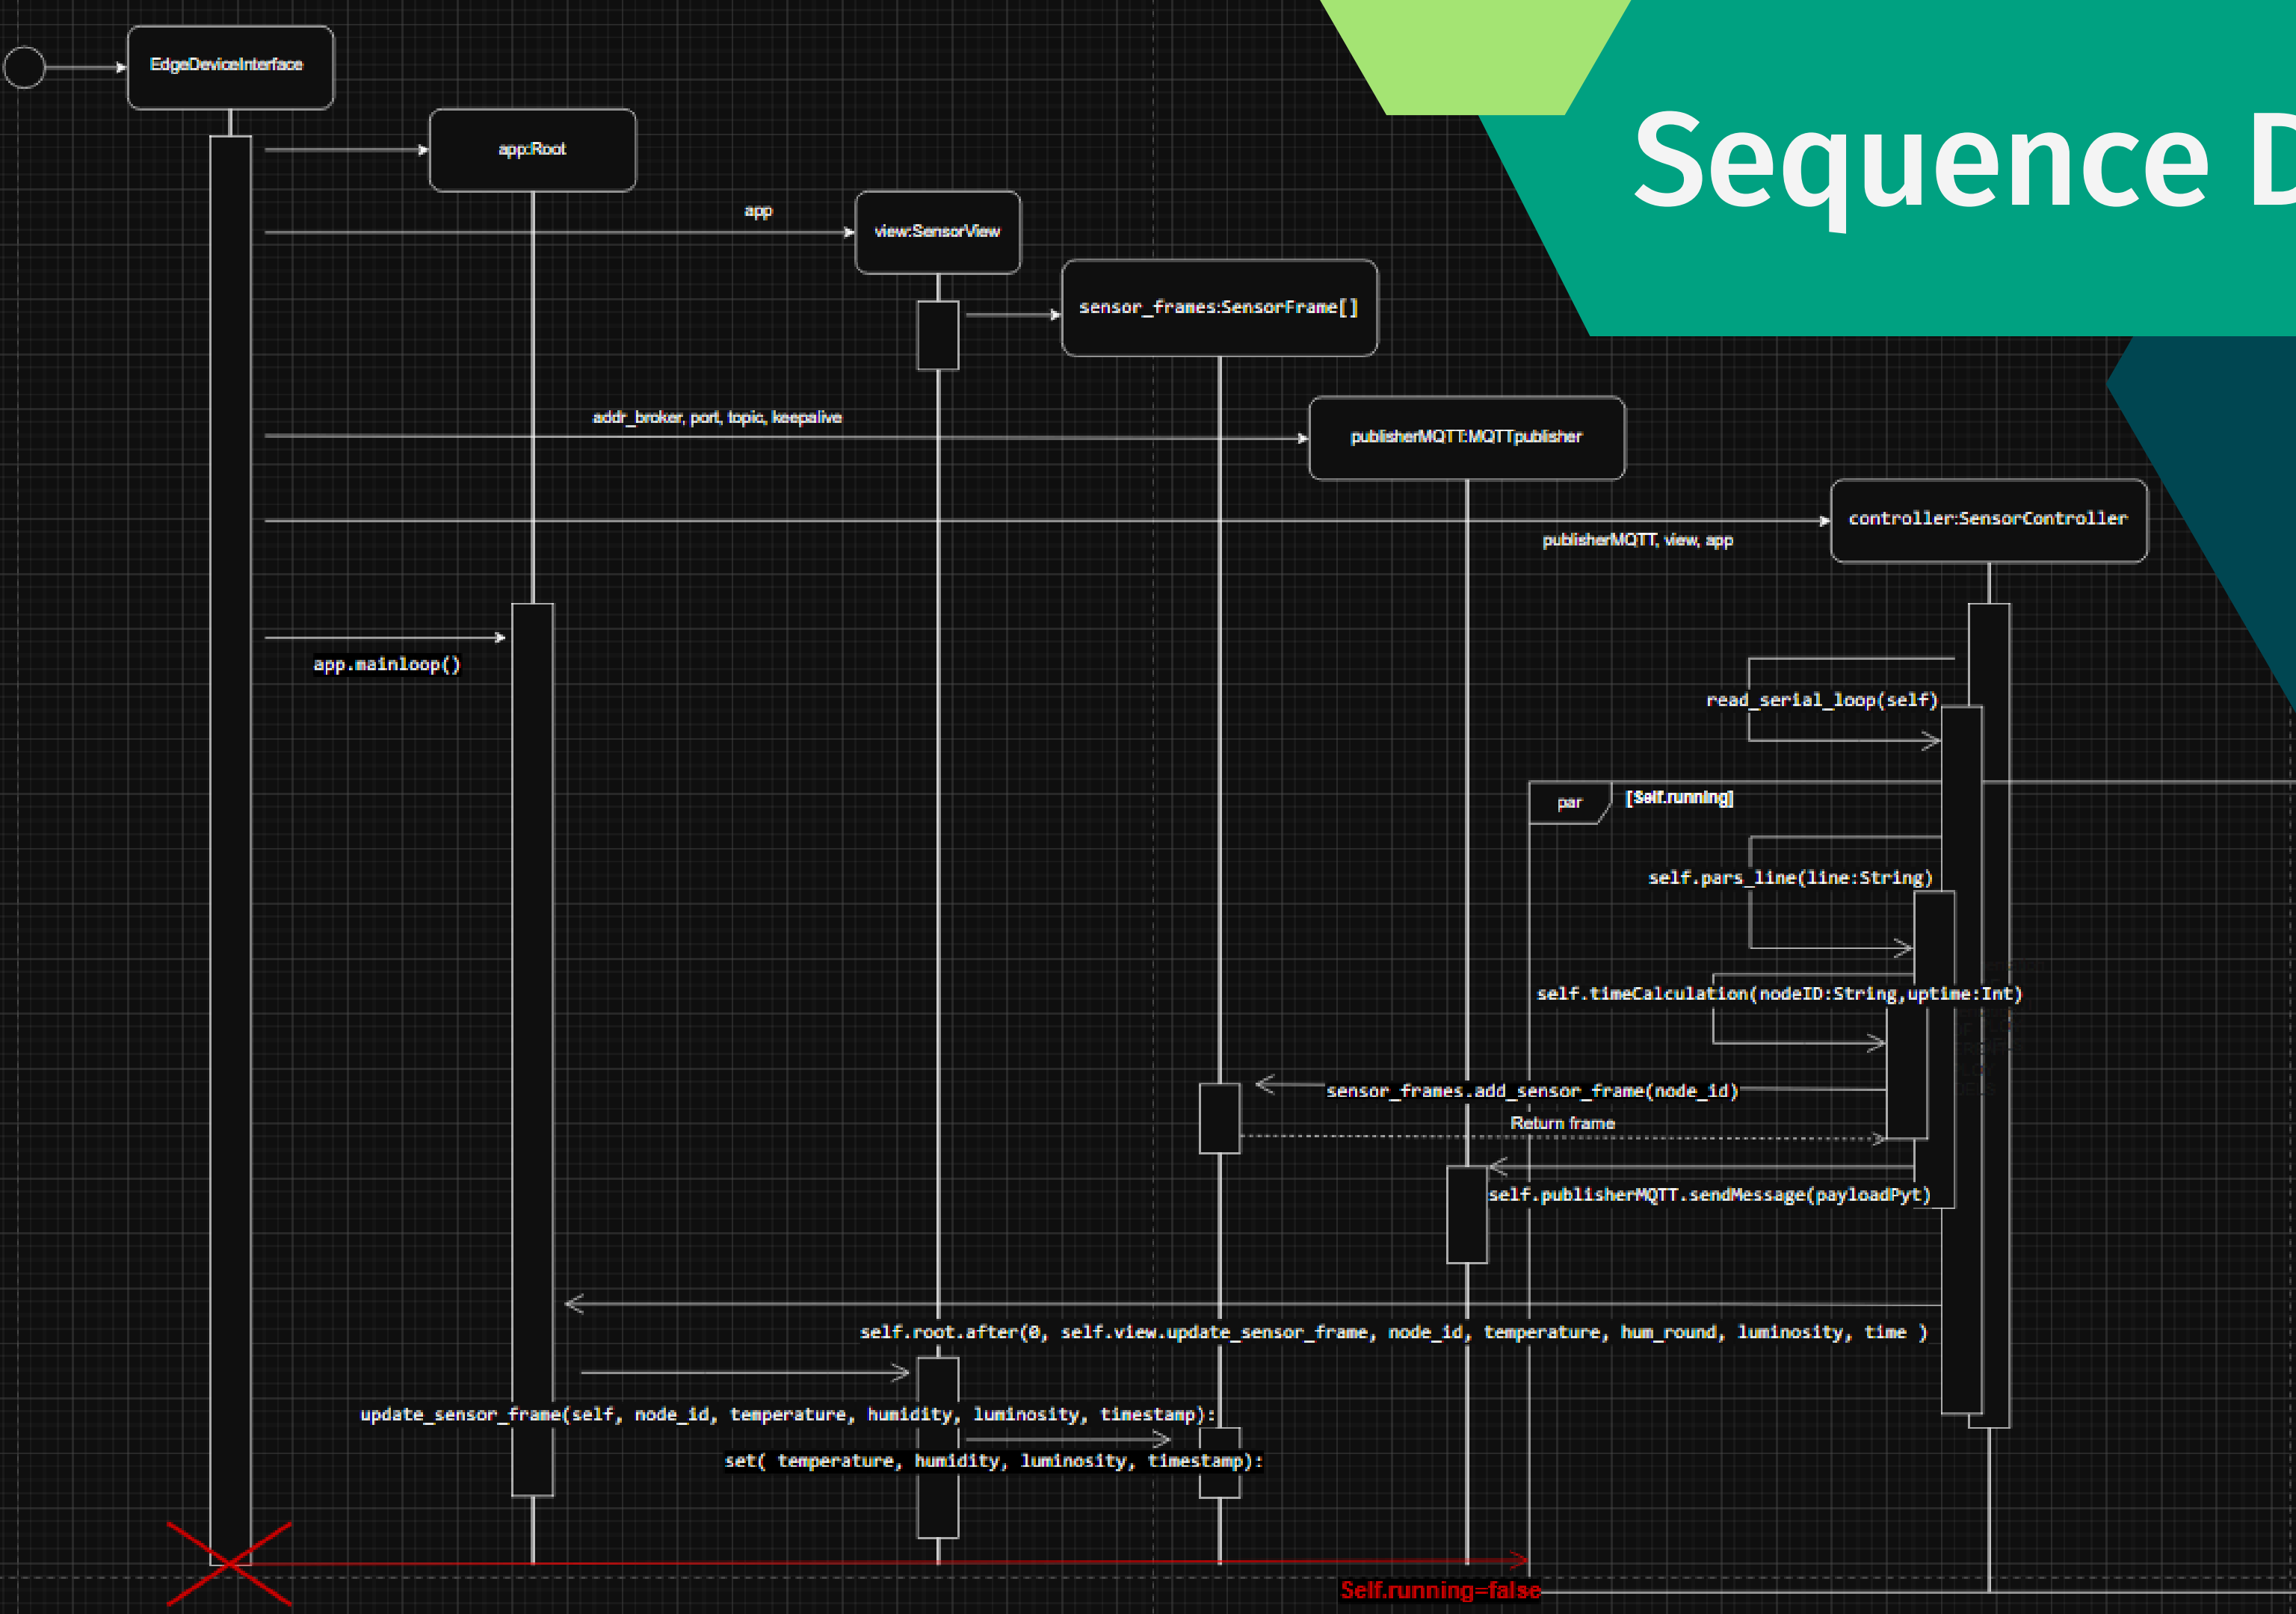

**SensorMsg.h**

# EDGE device

# Context-aware

## \*Scalable

**2\* ~ TelosB sensors to monitor temperature, humidity and luminosity**

**1\* ~ TelosB base station**

**1\* ~ PC that act EdgeDevice**

**1\* ~ Android mobile Device**

# Challenges

- **Measurement Frequency**
- **Radio communication fails between TelosB**
- **Sensors Placement**
- **Uncertainty**

# Challenges

- **MQTT implementation with QoS=1 to balance RealTime constraints & Reliability**
- **Flow management**

# Challenges

- **Integration of Node-red and InfluxDB**
- **Integration of InfluxDB and Grafana**

# Challenges

- **Design following the JetPackCompose Paradigm**
- **Real time synchronization with the sensors datas on Firebase**

# Features

Dashboard that provides real-time visualization of the sensors datas

Real time synchronization with Android mobile devices

Cloud integration to store and share data

Easy scalable system

# What did we use?

<b>TinyOS (.nc)</b>	<b>Python</b>
<b>Firebase</b>	<b>MQTT (Nodered+ Mosquitto)</b>
<b>Grafana</b>	<b>Android</b>

# Future development

Implementation of actuation to change temp, hum, lum	Reinforced learning model for auto-regulation of the actuators
Implementation of area data inference model	Advise deployment AI System for better positioning of the sensors

# Git-Hub

## Network graph

Timeline of the most recent commits to this repository and its network ordered by most recently pushed to.
